
Software version:

MYSQL 5.7.33-0ubuntu0.18.04.1 (Ubuntu)

Import database

- 1) Load MYSQL server by your username and password
- 2) Create a new database named **metabolism**.

```
CREATE DATABASE metabolism;
```

- 3) import SQL file.

```
source metabolism.sql;
```

Export database:

```
mysqldump -u root -p metabolism > metabolism.sql
```

Configure the database information in PHP (config/config.php)

```
$host='127.0.0.1'; //database IP  
$database='metabolism'; //database name  
$user='zju_meta'; //database username  
$pass='973254023'; //database password  
$path=''; //The install path for MYSQL, If environment variables are configured, you  
can ignore this setting.
```

Database tables

Jobs Stores user-built project information.

ref_meta This table stores information for the data source of the refMeta database.

ref_meta_data This table stores information about metabolized compounds of refMeta database.
